

Technical instructions “Small Hive Beetle Trap”

Thank you for your purchase decision. In order to make sure you can use our quality product effectively for years please see the instructions for installation and usage.

The Small Hive Beetle Trap consists of two different plastic parts and two structurally identical silicon membranes. As shown on the product drawing below, the lower part is brown and the upper part is green. In order to kill the pest, the trap should be put into the freezer for minimum 10 hours or into the microwave for at least 10 seconds. Afterwards the trap can be opened to clean it. Carefully release the snap locks. On the sectional drawing they can be clearly seen on the left side. A small tug tells you that the “hook” (green) is disengaged. When assembling the trap first insert the lid into the interlock on the right side. Hold the lid at a slight angle and slide it into the lower part with the pins first. Then the lid can be pressed down and the snap lock closes.

To install the trap four oblique planes are provided, three on the upper side and one on the right side. The three upper ones are for perfectly connecting the trap onto the bottom board, the right side one is for clearance-free mounting the adaptor or the bottom.

ATTENTION:

Use only little pressure and no tools when positioning the wedges
